Charles Zheng

1 Background

Theorem 1. *Define* $\phi(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$ *and*

$$\Psi(x) = \int_x^\infty \phi(t)dt$$

for $x \in \mathbb{R}$. *Then*

$$\left(\frac{1}{x^3} - \frac{1}{x}\right)\phi(x) \leq \Psi(x) \leq \frac{1}{x}\phi(x)$$

Theorem 2. ***(Borell-TIS inequality)*** *Let* f_t *be a gaussian process such that* $\mathbb{E}[f_t] = 0$ *Then on any measurable set* D*, and* $u > 0$,

$$\mathbb{P}[\sup_D f_t > u + \mathbb{E}[\sup_D f_t]] \leq \exp(-u^2/(2\sigma_{max}^2))$$

where

$$\sigma_{max} = \sup_D \boldsymbol{E}[f_t^2]$$

Theorem 3. ***(Slepian's inequality)*** *If* f *and* g *are as bounded, centered gaussian processes, and*

$$\mathbb{E}[(f_t - f_s)^2] \leq \mathbb{E}[(g_t - g_s)^2]$$

then

$$\mathbb{P}[\sup_{t \in D} f_t > u] \leq \mathbb{P}[\sup_{t \in D} g_t > u]$$

2 Supremum of an isotropic GP

Theorem 4. *Let* f_t *be a gaussian process on* $\mathbb{R}$*, with* $Cov(f_t, f_u) = C(t-u)$*, where* $C(0) = 1$*, and* $C(t) \to 0$ *as* $||t|| \to \infty$*. Then supposing* f_t *is bounded on* $[0,1]$,

$$\mathbb{P}\left(\liminf_{T\to\infty} \frac{\sup_{[0,T]} f_t}{\sqrt{2\log(T)}} \geq 1\right) = 1$$

Proof.

It suffices to prove

$$\mathbb{P}\left(1 - \varepsilon \leq \liminf_{T\to\infty} \frac{\sup_{[0,T]} f_t}{\sqrt{2\log(T)}}\right) = 1$$

for arbitrary $\varepsilon \in (0,1)$.

Take $\varepsilon \in (0,1)$.

Find $\tau > 0$ such that $C(\tau) < \frac{\varepsilon}{2-\varepsilon}$ and find $T_0 > 0$ such that $T > \max\{2\tau, \frac{2-\varepsilon}{\varepsilon}\log(2\tau), e^{\frac{1-C(\tau)}{(1-\varepsilon)^2}}\}$. For each of $n = 1, \ldots,$, let $T = T_0 + n$, and let let $m = \lfloor \frac{T+1}{\tau} \rfloor$. Define $t_k = k\tau$ for $k = 1, \ldots, m$. Let $Z_1, \ldots, Z_m$ be iid $N(0, 1 - C(\tau))$. For $i \neq j$, we have

$$\mathbb{E}[(Z_i - Z_j)^2] = 2(1 - C(\tau)) \leq 2(1 - C((i-j)\tau)) = \mathbb{E}[(f_{t_i} - f_{t_j})^2]$$

Hence by Slepian's inequality,

$$\mathbb{P}(\sup_{t \in [0,T]} f_t > u) \geq \mathbb{P}(\max_{i \in \{1,\ldots,m\}} f_{t_i} > u) \geq \mathbb{P}(\max_{i \in \{1,\ldots,m\}} Z_i > u)$$

for all $u > 0$. Thus, taking $u = (1-\varepsilon)\sqrt{2\log(T+1)}$ so that

$$u \leq \left(1 - \frac{\varepsilon}{2}\right)\sqrt{2(1 - C(\tau))\log\left(\frac{T}{\tau} - 1\right)}$$

and

$$\frac{\sqrt{1 - C(\tau)}}{u} - \frac{(1 - C(\tau))^{3/2}}{u^3} \leq \frac{\sqrt{1 - C(\tau)}}{2u}$$

we have

$$\mathbb{P}(\sup_{t\in[0,T]} f_t < \sqrt{2\log(T-1)}(1-\epsilon)) \leq \mathbb{P}(\max_{i\in\{1,\dots,m\}} Z_i < u) \tag{1}$$

$$= \left(1 - \Psi\left(\frac{u}{\sqrt{1-C(\tau)}}\right)\right)^m \tag{2}$$

$$\leq \left(1 - \left(\frac{\sqrt{1-C(\tau)}}{u} - \frac{(1-C(\tau))^{3/2}}{u^3}\right)\phi\left(\frac{u}{\sqrt{1-C(\tau)}}\right)\right)^m \tag{3}$$

$$\leq \left(1 - \left(\frac{\sqrt{1-C(\tau)}}{2u}\right)\phi\left(\frac{u}{\sqrt{1-C(\tau)}}\right)\right)^m \tag{4}$$

$$\leq \exp\left(-m\left(\frac{\sqrt{1-C(\tau)}}{2u}\right)\phi\left(\frac{u}{\sqrt{1-C(\tau)}}\right)\right) \tag{5}$$

$$\leq \exp\left(-m\left(\frac{\sqrt{1-C(\tau)}}{2u}\right)\phi\left(\left(1-\frac{\varepsilon}{2}\right)\sqrt{2\log\left(\frac{T}{\tau}-1\right)}\right)\right) \tag{6}$$

$$= \exp\left(-\frac{m}{\sqrt{2\pi}\left(\frac{T}{\tau}-1\right)^{(1-\frac{\varepsilon}{2})^2}}\left(\frac{\sqrt{1-C(\tau)}}{2u}\right)\right) \tag{7}$$

$$\leq \exp\left(-\frac{\frac{T}{\tau}-1}{\sqrt{2\pi}\left(\frac{T}{\tau}-1\right)^{(1-\frac{\varepsilon}{2})^2}}\left(\frac{\sqrt{1-C(\tau)}}{2u}\right)\right) \tag{8}$$

$$= \exp\left(-\frac{\left(\frac{T}{\tau}-1\right)^{1-(1-\frac{\varepsilon}{2})^2}}{\sqrt{2\pi}}\left(\frac{\sqrt{1-C(\tau)}}{2(1-\varepsilon)\sqrt{2\log(T-1)}}\right)\right) \tag{9}$$

$$= \exp\left(-\frac{\left(\frac{T_0+n}{\tau}-1\right)^{1-(1-\frac{\varepsilon}{2})^2}}{\sqrt{2\pi}}\left(\frac{\sqrt{1-C(\tau)}}{2(1-\varepsilon)\sqrt{2\log(T_0+n-1)}}\right)\right) \tag{10}$$

Hence

$$\sum_{n=1}^{\infty} \mathbb{P}(\sup_{t\in[0,T]} (1-\varepsilon)\sqrt{2\log(T_0+n-1)}) < \infty \tag{11}$$

which by Borel-Cantelli implies the result $\square$.

Theorem 5. *Let f_t be a gaussian process on $\mathbb{R}$, with Cov$(f_t, f_u) = C(t-u)$, where $C(0) = 1$, and $C(t) \to 0$ as $||t|| \to \infty$. Then supposing f_t is bounded on $[0,1]$,*

$$\lim_{T\infty\infty} \mathbb{P}\left(1-\varepsilon \le \lim_{T\to\infty} \frac{\sup_{[0,T]} f_t}{\sqrt{2\log(T)}} \le 1+\varepsilon\right) = 1$$

for all $\varepsilon \in (0,1)$.

Proof.

The lower bound follows from the previous result. Let $\mu = \mathbb{E}[\sup_{[0,1]} f_t]$, so that

$$\mathbb{P}[\sup_{t\in[0,1]} f_t > u] \le e^{-(u-\mu)^2/2}$$

for all $u > \mu$. For any $T > 0$, letting $n = \lceil T \rceil$ using union bound and isotropy, we have

$$\mathbb{P}[\sup_{t\in[0,T]} f_t > u] \le \mathbb{P}[\max_{i=\{1,\ldots,n\}} \sup_{t\in[i-1,i]} f_t > u] \le n\mathbb{P}[\sup_{t\in[0,1]} f_t > u] \le ne^{-(u-\mu)^2/2}$$

for all $u > \mu$. Therefore, defining $u = (1+\varepsilon)\sqrt{2\log(T)}$, and taking n large enough so that $u > \mu$, we get

$$\mathbb{P}[\sup_{t\in[0,T]} f_t > u] \le ne^{-(u-\mu)^2/2} = \frac{n}{(n+1)^{(1+\varepsilon)^2}} \exp\left(-\mu(1+\varepsilon)\sqrt{2\log(n+1)} - \frac{\mu^2}{2}\right)$$

which tends to 0 as $T \to \infty$. $\square$
